

FIT1013 Digital Futures: IT for Business

Assignment 2 Developing an application using Excel (VBA) (35%)

Part 1: Sunday, 25 September 2022, 4:30 PM

Part 2: Friday, 14 October 2022, 4:30 PM

Group Assignment (Maximum of 3 students)

Learning Objectives

Upon successful completion of this assignment, you should be able to:

- i. Use appropriate data types, declare and use variables and/or constants
- ii. Write event procedures for some Excel and VBA objects.
- iii. Use repetition and selection structures in VBA code
- iv. Use the Workbook, Worksheet and Range objects
- v. Use other objects as necessary
- vi. Perform data validation on user input
- vii. Construct arithmetic expressions in VBA code
- viii. Follow appropriate rules relating to the scope of variables
- ix. Design user forms using a variety of controls
- x. Apply other useful worksheet functions where appropriate, e.g. Vlookup() and Format() functions in VBA code.

Group Assignment

- This assignment promotes students' collaborations working in groups. Students must form their assignment grouping within the same applied session, the latest being the end of Week 8. You will choose your group via the Assignment Two Groups (see Moodle Assessments page). Students who did not form a group by the end of Week 8 will be allocated to a random group - minimum one student, maximum three students.
- Every student in the group is required to participate actively and contribute to all parts of the assignment (i.e. not dividing tasks). At the end of the assignment, all students must complete their Peer Evaluation (to be made available in Moodle) confidentially and individually. These would be used as a basis for marks adjustment for the assignment's final score (if necessary). Failure to complete the assignment peer evaluation by the due date will result in a lower mark for the final score.

Submission Requirements

- You are required to submit the assignment via Moodle as an MS Excel Macro-Enabled Workbook. The filename should include the Unit Code, assignment number and your Group ID/number, following this format: FIT1013A2_GroupID.xlsm
- Submit timesheets (FIT1013A2_GroupID_Timesheets.xlsx) that contain each member's timesheet.
- Only one of the group members will need to upload the assignment files on Moodle for the group, but all members must click the 'submit' button to accept the student submission statement.

Late Submissions

The late-submission penalty is 10 percent of the available marks in that task, not the marks you received. For instance, an assignment has 100 marks, and you submitted the assignment one day late and received 65 marks. In this case, the penalty is 10 marks deduction (10% of the total available marks).
 $65 - (10\% \text{ of } 100) = 55 \text{ of } 100 \text{ marks.}$

Assessment Criteria

The assessment will give attention to how well you demonstrate your skills to complete the tasks – e.g. ensure all assignment requirements are met, fulfil the functional requirements of the scenario, the development is robust and maintainable.

It is important for each team member to contribute and participate equally, otherwise, you will be marked based on the amount of effort and quality of the work that you produce. You should not divide the tasks among yourselves – the assignment will be assessed as a group.

Demonstrate your application (Part 1 and Part 2) to your tutors in Week 10 and Week 12 respectively (see Requirements section). This will allow you to explain your design. Any student who fails to turn up to any of the demonstrations will fail that component of the assignment. In addition to the marks allocated for the tasks that require demonstration, some marks are allocated for demonstration, e.g. for clarity and understanding.

Scenario

Fashion industry analysts note that new fashion trends emerge on average every 10 weeks. For someone to be in step with fashion, they would need to change at least part of their wardrobe that frequently. People often feel that they cannot wear an outfit repeatedly because their friends have seen that outfit on social media. It is also predicted that in 3-5 years, people might go on vacation without taking a suitcase. They will instead arrive at their hotel rooms with only one small bag, and they will find their closets already filled with rented clothing.

Located at the intersection of the sharing economy, SAF (Simon's Amazon of Fashion) buys designer dresses wholesale and rents them for only a fraction of the price of the dress. For example, SAF's customers can wear an Armani gown that costs thousands of dollars for only \$100.

So far, all rentals are recorded using simple Excel sheets. Due to the increase of orders, SAF requires a computer application to help them to manage the product information, customer details, orders placed by the customers as well as deliveries and collections of the apparels. This application should be written in Excel (VBA), so that they can improve their current rental management system. The CEO of SAF, Mark is now contracting you to develop an Excel application (file can be saved in ".xslm" extension) that integrates what they currently have into several more user-friendly interfaces, in order to maintain their day-to-day business.

The CEO has provided the Excel spreadsheets that they currently use to maintain their transactions – "FIT1013 A2_2022.xlsx". Please note that this file does not contain all their rental data (for business privacy), but they are enough for you to understand the business scenario. Some of the data in the file are de-identified due to privacy issues but they maintain the same structure. Some of the data are imported from the deliver-collect tracking system (the development of the deliver-collect tracking system is not in the scope of this assignment). Your application should work the same using the provided actual data. In short, do not change any format or structure of the original data in the worksheets, unless stated otherwise. Mark reminded you that the application is to be developed in Microsoft Excel (English version) so that he and his employees can run the application smoothly on their computer. He would also like you and your group to show him your work progress (demonstration) so that he can be sure that the application is completed on time. Failing to do so may result in reduced payments or cancellation of the project.

Other documents that need to be submitted are individual timesheets for payment purposes. Failure to do so may result in penalties like reduced payments. The template for the timesheet is available in Moodle.

Part 1 Requirements

Functionality

1. A user form named “Main Menu” is presented upon opening the workbook. The user form will contain buttons to perform the key activities described in the points below. If the user closes the form, it should be possible to bring the form back by clicking on the button named “Show Menu” in the ‘Menu’ worksheet. This form should display the following buttons:
 - i. Customer Information
 - ii. New Order
 - iii. Complete Rental
 - iv. Display Rental

Consider using shortcut keys/accelerators and tab order for your buttons.

(2 marks)

2. A user form named “Customer Information” will be shown when the corresponding button in the main menu is clicked. It allows the details of a customer to be added, deleted or modified. This form should allow users to cancel/close the form, or to confirm before the details are added/deleted/changed to the “Customer” worksheet. If it is a new customer, then the details should be added under the last row.

Note: *To add a new customer, the Customer ID is generated automatically by the system and increments by 1 each time. E.g. if the ID of the last customer (last row) is 5, then the new customer ID is 6.*

Hint: *In order to modify or delete an existing customer, the user needs to enter the Customer ID, then other information will be populated to the user form.*

(3 marks)

3. A user form named “New Order” will open when the corresponding button in the main menu is clicked. It allows the user to enter the details of a new rental order.
 - i. The form should display the following information when it is opened: an auto-generated Rental ID (in chronological order), a list of customers, a list of products (dress name, colour, etc), will be made available for selection. Date can be entered manually (set default at current date and time).
 - ii. Note that more than one product can be ordered at a time (more than one item in a single delivery, see existing data in the Rental worksheet for examples). Design your application in such a way that the user can add more than one item in a single form, for the same customer.
 - iii. The form should include a ‘Confirm’ button that transfers the details of the new order to the Rental worksheet, updates product quantity in Quantity worksheet, then returns to the previous form i.e. “Main Menu”.
 - iv. Highlight the collection information (DateReturned, ReturnCondition, TotalAmount) for this rental in light colour (e.g. yellow).

(6 marks)

Documentations

Your application should be briefly documented on the first worksheet (which should be named ‘Menu’). The documentation should include:

- Group Number
- Authors’ details (Student ID & Name)
- Date of completion
- Instructions on how to use the application (including any features used or assumptions made)

Submit timesheets (FIT1013A2_GroupID_Timesheets.xlsx) that contain each member’s timesheet.

Complete the Peer Evaluation form in Moodle individually.

(2 marks)

Demonstrations

Demonstrate your application to your tutors in Week 10. **(2 marks)**

Files Provided

FIT1013 A2.xlsx which contains the initial data for each sheet in the Excel file.

- Customer worksheet contains information about customers.
- Dress worksheet provides information about the various products that are available.
- Quantity worksheet provides information about the quantity on hand for the products.
- Rental worksheet with the detailed information for each rental.

Notes and Assumptions:

1. Please note that some of the details may not be normalised, as our intention is to cover mainly on the functionalities rather than the data recorded in the sheets.
2. If you are an experienced VBA programmer and know other features and plug-ins that are not covered in this unit's materials, please speak to your tutor before using them. You must be using VBA version 6.0, NOT VB.NET, which is available in Office 2019 and Microsoft Office 365.
3. Please check with your tutors if you have any assumptions.
